SHIMOPAY

Payments that don’t stop when the network does.

Authorize in local currency. Settle in USDC on Solana once connectivity returns.

Identity

Offline authorization

On-chain settlement

01 · SHIMOPAY

A small purchase should not stop when connectivity does.

Payments that require online authorization leave customers and merchants waiting when the network fails.

Customer disconnected

Purchase interrupted

Merchant waiting

02 · SHIMOPAY

Separate authorization from settlement.

An on-chain reserve bounds the session key. The customer signs locally; the merchant verifies locally and settles when online.

Reserve online

Authorize offline

Settle online

03 · SHIMOPAY

R$25 at checkout.
USDC at settlement.

The USDC amount is fixed before signing using a valid cached FX quote. The customer sees the local purchase currency.

Charge: R$25.00

FX: R$5.50 / USDC

Settlement: 4.545455 USDC

04 · SHIMOPAY

Only one side needs to reconnect.

The merchant can submit the intent and receive USDC while the customer stays offline. Local authorization makes no blockchain call.

05 · SHIMOPAY

The session is at the heart of ShimoPay.

Identity + device key + escrow + policy + cached FX + signed intent. The adapter connects authorization to the settlement rail.

07 · SHIMOPAY

Clear limits.
Bounded risk.

Reserve, expiry, signature, recipient and nonce are checked. Isolated merchants can still accept conflicting intents; offline acceptance is not final settlement.
